DOCUMENT REVISION HISTORY

Date	Reason for revision	Version	Document Type	Author
13/04/2026	First draft	V.1	Proposal	Priyanshi
21/04/2026	Second draft	V.1.1	Proposal	Priyanshi
11/05/2026	Third Draft	V1.2	Proposal	Priyanshi
03/06/2026	Fourth Draft	V1.3	Proposal	Priyanshi

Document On-Holds

This document outlines the general scope of the project based on the discussions and requirements provided and conversations held till date. The main objective at this stage is to ensure that all parties agree upon the general scope, budget, and schedule of the project before commencing work on subsequent stages (which can include in-depth planning if needed).

Clients are urged to ensure that all the details contained within this document are clear and fully meet their requirements before further work commences. Timescales mentioned only cover the scope listed, if this changes, costs and timings will change accordingly.

Once you are happy, contact us and we will progress into the next stages. This may include further detailing requirements and functionality or it may go straight into the design. This will depend on the nature of the project.

Project Objective

The objective of this project is to build a unified travel platform that enables users to plan and book their trips within a single system. The platform will bring together flights, hotels, and cab bookings along with itinerary creation and package exploration, allowing users to move from planning to booking without switching between multiple tools.

From a user perspective, the platform is designed to keep the journey clear and easy to follow:

- Users can begin from different entry points such as search, itinerary planning, or package exploration
- The transition between planning and booking remains smooth, without requiring repeated inputs
- All bookings and itineraries are accessible in one place for better visibility
- Key updates such as booking status and confirmations are clearly communicated
- Users are guided toward relevant alternatives when results are not available

From an operational standpoint, the platform will be supported by a centralized admin system that provides complete control over bookings, users, content, and integrations, while remaining reliable and easy to manage as the platform grows.

Core System features: User Panel

1. Authentication & Onboarding:

- **Authentication:**
 - Users can register and log in using:
 - Email-based signup and login
 - Google login for faster access
 - Forgot password and reset password
 - User sessions are maintained securely so that all activity (bookings, itineraries, searches) remains tied to the correct user account.
- **User Data Persistence:**
 - All user actions (searches, bookings, itineraries) are stored against the user profile
 - Enables continuity across devices and sessions
- **User Onboarding:**
 - After registration, users can optionally provide basic inputs that helps to personalize the app experience:
 - Travel preferences
 - Budget range
 - Travel style
 - Trip type (solo, couple, family, business)
 - This input can later be used to improve AI recommendations, itinerary outputs, package discovery relevance, and overall personalization across the application.

2. Home Dashboard:

The home screen is the primary entry point and allow users to immediately start their journey.

- **Dashboard Key Elements**
 - A destination search bar for travel exploration
 - Clear primary entry actions for:
 - Flights
 - Hotels
 - Cabs
 - AI Chat
 - Create Itinerary
 - Users can directly enter any flow based on their intent.

- **Entry Behavior**

- Returning users see:
 - Recent searches
 - Previous bookings
 - Saved itineraries
- New users are guided toward:
 - Package discovery
 - AI chat

- **Discovery Sections**

- The home screen will also have package related content blocks such as:
 - Packages by budget
 - Packages by destination
 - Packages by travel type
 - Trending packages

- **User Activity**

- The dashboard will also include quick-access sections for:
 - Recent searches
 - Saved itineraries
 - Previous bookings
 - Favourite/ saved Packages
- This allows users to resume their journey without starting over.

3. Flight Booking Module:

Users can search, compare, and book flights via third-party integrations. The platform handles the interface, while pricing and availability come from the provider.

- **Search**

- Users can search flights by entering:
 - Origin
 - Destination
 - Dates
 - Number of passengers
 - Cabin class
- Search Behavior
 - To make it easier for repeat users:
 - Recent searches can be reused
 - Basic validations will be in place (like past dates, incorrect routes, etc.

- **Results Listing**

- Once results load, users will see a list of available flights with:

- Airline
 - Departure and arrival time
 - Total duration
 - Number of stops
 - Price
- **Filters & Sorting**
 - Users can narrow things down using:
 - Price
 - Airline
 - Duration
 - Stops
 - Sorting options (such as cheapest, fastest, or best value) can be applied based on user preference.
- **Flight Detail Page**
 - On selecting a flight, users will be able to review:
 - Full journey breakdown
 - Layovers
 - Baggage info
 - Fare details
- **Checkout**
 - The checkout flow will capture:
 - Traveler details
 - Contact details
 - Payment information
- **Fare Validation & Payment Handling**
 - Before payment is processed:
 - The fare is revalidated with the provider
 - Any change is surfaced to the user immediately
 - To maintain transaction reliability:
 - Duplicate booking attempts are restricted
 - Failed payments can be retried without restarting the flow
- **Booking Confirmation**
 - Once the booking is successful:
 - A booking reference is generated
 - Ticket details are presented
 - The booking is stored in the user's account for future access
- **Post-Booking Flow**
 - After confirming a flight, users are naturally guided to continue planning:
 - Hotel booking for the same dates

- Add Cab for airport transfer
- Itinerary creation
- **Booking Management**
 - Once a booking is completed, the user should be able to access and manage it from their account. This includes:
 - Viewing complete booking details
 - Cancelling the booking (as per airline/provider rules)
 - Tracking refund status where applicable
- **Fallback Handling**
 - If no flights are available for the selected criteria:
 - Users can adjust filters or travel dates
 - Modify origin or destination
 - Explore alternative routes
 - In addition, users can continue with:
 - Package discovery
 - Itinerary planning
- **Important Note**
 - The flight module operates on top of the integrated flight aggregator.
 - Pricing and availability are fetched in real time
 - All fares remain subject to change until final confirmation
 - Cancellation, refund, and modification rules are governed by the provider
 - The platform displays this data but pricing, availability, and policies are controlled by the provider

4. Hotel Booking Module:

The hotel module follows a similar structure, with real-time inventory coming from the connected provider and the platform handling the full user experience.

- **Search**
 - Users can search by entering:
 - Destination
 - Check-in / Check-out dates
 - Number of guests
 - To support different search behaviors:
 - Location suggestions appear while typing
 - Landmark-based searches are supported (airport, city center, etc.)
 - Inputs are validated to avoid incomplete or incorrect searches
- **Listings**
 - Results are displayed as hotel cards, each showing:

- Image
- Price
- Rating

- **Filters**

- Users can refine results based on:
 - Price
 - Rating
 - Amenities
- Additional filters can be added depending on provider data.

- **Hotel Detail**

- On opening a hotel, the user should be able to view:
 - Images
 - Amenities
 - Room categories

- **Room Selection**

- Users can then proceed to choose:
 - Room type
 - Occupancy
 - Rate plan
- To improve flexibility and pricing accuracy:
 - Multiple room selection can be supported (future-ready)

- **Availability Handling**

- Before checkout:
 - Real time room availability is revalidated
 - Sold-out scenarios are handled clearly

- **Checkout & Confirmation**

- Guest details and payment are captured
- Booking summary is shown
- Stored in booking history

- **Booking Management**

- Post-booking, users should be able to:
 - View booking details
 - Cancel booking where hotel/provider policy permits
 - Review refund visibility and cancellation policy implications

- **Policy Visibility**

- To ensure transparency during decision-making, the system will clearly display:
 - Refundable vs non-refundable rate status

- Applicable cancellation deadlines
- These details will be visible at both the room selection stage and within the booking details, helping users understand the implications of the selected rate plan before confirming the booking.
- **Post-Booking Suggestions**
 - After hotel booking confirmation, users are suggested to:
 - Add cab for local or airport travel
 - Create itinerary for the trip
 - Explore related package
- **Important Note**
 - Hotel availability, room inventory, pricing, and booking rules depend on the connected hotel aggregator. The system consumes this information in real time.
 - In case no hotels are found, the system should help the user:
 - Adjust search filters
 - Change stay dates
 - Broaden location selection
 - Continue to package discovery or itinerary generation

5. Cab Booking Module (Internal System):

Cab bookings will be managed within the platform, giving full control over operations instead of relying on external ride services.

- **Cab Booking Flow**
 - Users will:
 - Enter pickup and drop locations
 - Select date and time
 - Choose vehicle type
 - View fare
 - Confirm booking
- **Internal Workflow**
 - Once the booking is placed:
 - The request is stored in the system
 - Admin or vendor assigns a driver
 - Driver details are then shared with the user
- **Status Updates**
 - Users should be able to track the booking through statuses such as:
 - Pending
 - Assigned
 - On the way

- Completed
- Cancelled

- **User Tracking**

- The user should be able to open the booking detail at any time and track the latest cab booking status until completion.

- **Post-Booking Experience**

- After the cab booking is created, the user should be able to:
 - View booking details
 - Track assignment updates
 - Contact support if necessary

6. AI Chat Assistant:

The AI chat assistant will act as a guided conversational layer across the app. It is intended to help users with planning, recommendations, and direction.

- **Chat Access**

- The AI assistant will be accessible through a floating button across the application so that users can enter a conversational journey from different screens.

- **Capabilities**

- The AI assistant can support users with:
 - Travel planning suggestions
 - Budget- based recommendations
 - Destination guidance
 - Assistance during booking decisions

- **Behavior**

- The assistant will be able to:
 - Collect user inputs conversationally
 - Understand planning intent
 - Trigger itinerary generation
 - Guide users toward relevant next steps
- To make the interaction more effective and intelligent:
 - Responses will adapt based on current user inputs.
 - The assistant will be able to handle both structured queries and open-ended requests (e.g., “plan a cheap trip to Goa”)

- **Redirections**

- The AI assistant should be able to redirect users to:
 - Itinerary creation
 - Booking flows

- Package exploration
- The AI assistant should not remain isolated as a support-only layer. It should actively help move users toward:
 - Completing bookings
 - Generating itineraries
 - Discovering relevant packages
- To support this, the assistant may present direct action prompts such as:
 - “Book Flights”
 - “Create Itinerary”
 - “Explore Packages”

7. AI Itinerary Module:

Users can create structured travel plans either directly or through AI interaction.

- **Dedicated Itinerary Creation**

- Users can generate an itinerary directly by entering:
 - Destination
 - Number of days
 - Budget
 - Preferences

- **AI Chat-Based Itinerary**

- Users can also generate itineraries conversationally through the AI assistant. In this case, the AI may gather trip details step by step and then produce a structured itinerary.

- **Generation Logic**

- The itinerary will be generated based on:
 - User inputs
 - AI inference
 - Defined preferences

- **Output**

- The itinerary output will include:
 - Day-wise itinerary
 - Activities with time and description
- Dining, culture, and similar suggestions may appear only as informational itinerary content. These are not separate bookable modules anywhere else in the application.

- **Actions**

- Once generated, the user should be able to:
 - Save itinerary
 - Regenerate

- Continue to booking
- **Saved Itineraries**
 - Generated itineraries should be stored so the user can access them later from account history or dashboard shortcuts.
- **Booking Continuation**
 - Users should be able to move from itinerary to booking flows without re-entering information. When launched from itinerary, booking flows should prefill relevant travel context such as:
 - destination
 - dates
 - related planning context where applicable
 - This ensures a smooth transition from planning to execution.

8. Travel Package Discovery Module:

- This module supports curated package exploration and inquiry-based package booking.
- **Listing Types**
 - Users should be able to browse packages by:
 - Budget
 - Location
 - Duration
 - Travel type
- **Package Detail**
 - Each package detail page should include:
 - Overview
 - Inclusions preview
 - Indicative price range
 - Images
- **Booking Flow**
 - Package booking in this scope will not be automated in-app checkout. Instead, the detail page will clearly show:
 - Contact number
 - Call CTA
 - WhatsApp inquiry CTA
- **Direct Redirection**
 - From the package detail page, users should be able to directly move into the contact / call inquiry flow without confusion.
 - After inquiry, users may:
 - Continue browsing more packages

- Return to the dashboard
- Explore direct booking flows if preferred
- **Lead Tracking**
 - All call/WhatsApp clicks logged in backend.

9. Booking Details & History:

- Users will have access to a centralized history section where all their activity is available in one place, including:
 - Flight bookings
 - Hotel bookings
 - Cab bookings
 - Saved itineraries
- Bookings will be clearly grouped by type (flights, hotels, cabs) to make navigation and access straightforward.
- **Booking Detail Page:**
 - Each booking detail page should clearly show:
 - Full summary
 - Payment details
 - Current status
 - Cancellation option if available
 - Contact support

10. Booking Status & Payment Handling:

- To support a complete booking lifecycle, each booking will reflect both its status and payment state clearly.
- **Booking & Payment States**
 - The system will support:
 - Payment success / failure
 - Booking pending / confirmed / failed
 - Cancelled bookings
 - Refund requested / processed
- **Handling Rules**
 - Flights and hotels will follow provider-based cancellation and refund policies
 - Cabs will follow internal handling rules
- **Failure Handling & Safety**
 - Users will be able to retry failed payments or reinitiate bookings
 - The system will prevent duplicate charges and verify payments before confirmation

11. Notifications:

- Users should receive key notifications throughout the journey, including:
 - Booking confirmations
 - Payment updates
 - Cab assignment updates
 - Itinerary ready alerts
 - Package inquiry acknowledgement
- **Delivery Channels**
 - In-app notifications
 - Optional email notifications

12. Support Module:

- The application should include a dedicated support/help layer containing:
 - Help section
 - About Us
 - FAQs
 - Contact Us
 - Booking-level support
- Support access should be visible globally where appropriate and also directly accessible from individual booking detail pages.

13. Empty States:

- The application should account for scenarios where:
 - Users do not have any data available to view (e.g., no bookings or saved itineraries)
 - A search does not return any results
 - Certain sections of the platform have no content to display at a given time
- These situations may occur across different parts of the application, including search flows, bookings, itineraries, and package discovery.
- In all such cases, the experience should remain clear and guided, ensuring users understand the situation and can continue without confusion or interruption.
- **System Behavior**
 - Instead of leaving users with empty screens, the system will:
 - Clearly communicate that no results are available
 - Provide relevant next steps based on the context of the screen
 - These actions may include:
 - Adjusting filters or inputs
 - Exploring alternative options within the same flow

- Redirecting to related sections such as package discovery or itinerary planning
- **Smart Suggestions**
 - Where applicable, the system can assist users by suggesting:
 - Nearby or similar destinations
 - Flexible date options
- These suggestions are meant to help users recover from dead-end scenarios without interrupting their journey.

Core Features- Admin Panel

1. Admin Access:

The admin system will support secure access for internal users.

- **Access Control**
 - Admin login
 - Forgot password / reset access
 - Secure session handling
- **Role-Based Access**
 - To support multiple internal teams, the system will allow:
 - Role-based access (e.g., Super Admin, Operations, Support)
 - Module-level permissions based on role

2. Dashboard:

- **Overview Metrics**
 - Total bookings (flights, hotels, cabs)
 - Revenue overview
 - User activity summary
- **Live Monitoring**
 - Active bookings
 - Pending bookings
 - Failed transactions

3. User Management:

- Admins will be able to manage and monitor platform users.
- **User Overview**
 - View all registered users
 - Access user profile details
 - View booking history per user
- **User Actions**
 - Block / unblock users
 - Reset user access if required

4. Booking Management:

The system will provide a centralized view of all bookings across modules.

- **Booking Overview**
 - Flights
 - Hotels
 - Cabs
- **Filtering & Search**
 - Filter by booking type
 - Filter by status (pending, confirmed, failed, cancelled)
 - Filter by date
- **Operational Actions**
 - View booking details
 - Track booking status
 - Handle escalations or support cases

5. Cab Management:

- **Driver Management**
 - Add and manage drivers/vendors
 - Track availability
- **Assignment Handling**
 - Assign drivers to booking requests
 - Update ride status
- **Operational Dashboard**
 - Pending requests
 - Assigned rides
 - Completed rides

All updates made here will reflect on the user side in real time.

6. Package Management:

- **Content Management**
 - Add / edit packages
 - Upload images
 - Update descriptions and inclusions
 - Manage pricing display
- **Visibility Control**
 - Enable / disable packages

- Update contact details for inquiries
- **Lead Tracking**
 - Track user inquiries from call/WhatsApp actions

7. Itinerary Monitoring:

- **Monitoring**
 - View user-generated itineraries

8. AI Chat Monitoring:

- The system will provide basic control and visibility over AI usage which allows continuous improvement of AI responses.
- **Usage Tracking**
 - Number of conversations
- **Configuration**
 - Update system prompts (if required)

9. Reports & Analytics:

- **Reports**
 - Revenue reports
 - Booking trends

These insights help in tracking platform performance and growth.

10. CMS (Content Management System):

- Admins will be able to manage static and informational content.
 - **Content Types**
 - FAQs
 - Policies
 - Static pages
 - This ensures that non-functional content can be updated without development effort.

11. Notification Management:

- **Control**
 - Enable / disable notifications
 - Configure notification content (if required)

12. Support and Ticket Handling:

- The system will support handling user issues and queries.
- **Support Management**
 - View and track user issues
 - Resolve support queries

Support requests can be linked to bookings for better context.

13. Third Party Configuration:

- Admins will manage third-party integrations.
- **Integration Control**
 - Configure flight and hotel APIs
 - Manage API keys

Dependency Note:

Flight and hotel modules depend on third-party providers. Any changes in provider availability, pricing, or policies may impact system behavior.

14. Payment & Refund Monitoring:

- Admins will have visibility into all transactions.
- **Transaction Tracking**
 - View all payments
 - Track booking-related transactions
- **Refund Monitoring**
 - Track refund requests
 - Monitor refund status

15. Contact Management:

- Admins will manage contact details used in package inquiries.
- **Control**
 - Update contact numbers dynamically
 - Ensure correct routing of inquiries

Resources

Resource Type	Availability	No. of Resources	Resource Responsibility
Project Manager	Full Time	1	Responsible for client interaction, Task breakdown & assignments
Business Analyst	Partial	1	Full-time involvement before the Project starts. Partial involvement after starting the project.
Designer	Full time	1	Full time involvement for crafting UI designs and frontend development assistance.
Developers	Full Time	3	Full time involvement of frontend, backend and mobile app developer for crafting Page structure and fully-functional development.
QA(Tester)	Full Time	1	Responsible for testing all the builds/versions

Technology Matrix

		Tools and Technology
Requirement gathering		MS Office - Word/Excel
Development sections	Admin Panel	React.js
	Frontend	Next.js
	Backend	Next.js
	Mobile (Frontend)	Flutter
	Database	PostgreSQL
Quality Assurance	Testing	Manual

Our Approach

S.No	Phases	Input	Actions	Output
1	Requirement Analysis	Client-approved feature list and project scope. Competitor research. Discussions with stakeholders.	Conduct discovery sessions to clarify goals. Analyze requirements and identify key features. Document functional and non-functional requirements.	Finalized requirements document . (SRS). Finalized tech stack and architecture diagram .
2	UI/UX Design	Approved requirements document. Brand guidelines (if provided).	Develop clickable prototypes for client feedback. Iterate on designs.	Finalized high-fidelity designs Design assets (icons, color palette, etc.).
3	Backend Development	Approved designs and Documents. API contracts and database schema.	Set up repositories, CI/CD pipelines, and dev environments. Develop an app in sprints , starting with core features. - Integrate APIs for maps, payments, etc.	Incremental builds for customer, driver, and admin interfaces. Fully functional backend APIs.
4	Quality Assurance	Development builds from sprints.	Perform functional, performance, and compatibility testing . Conduct security testing for data privacy and compliance. Fix bugs and perform regression testing.	Bug-free app ready for staging.
5	Deployment	Approved staging version of the app. Deployment credentials (App Store, Play Store, hosting).	Deploy staging version for final UAT testing . Launch production version on App Stores and hosting platform.	Published app on Google Play Store/Apple App Store . Deployed web app and admin panel.
6	Post-Deployment Support	User feedback and analytics.	Address post-launch bugs/issues. Plan feature enhancements for the	Post-launch performance reports . An updated app with a feature enhancements

next phase.

document.

About Appic

[Appic Software](#) was incorporated in 2019 and has grown rapidly ever since.

We are a leading Website and Mobile App Development Company. We specialise in designing, developing, and launching websites and mobile applications for clients across various industries.

Our team of experts is dedicated to providing you with the best possible experience, and we are committed to working closely with you to ensure that all of your needs are met.

Our services include:

- Custom website design and development
- Mobile app development (iOS and Android)
- CMS (Content Management System) development
- Website and App maintenance and support

Expertise

App Development - iOS, Android, Flutter, React, Ionic,
Web Development - HTML, CSS, JS, Angular, React, Nginx
Backend development: NodeJs, PHP, Firebase, Ruby on Rails, Java, .Net
Database: MySQL, MongoDB, PostgreSQL
Server - AWS, Digital Ocean, Hostinger
OS - Windows, Linux, Mac
Code Version Control - Github, GitLab
Project Management Tools - JIRA, Zaplin, Trello, Basecamp

* and other emerging technologies

Portfolio

 Portfolio_Appic Softwares

Pricing

We offer to 1 or more developers for each of the above-mentioned Skills ranges from **10\$- 25\$/hour** with working of **8 hours/day**.
We also work on a milestone basis where we divide projects into smaller sprints as per the project deliverables.

Project Management Process

We follow Agile methodology and development models. The web application development shall take the following route:

- Requirements gathering and analysis

- User interface prototyping
- Implementation (Programming – broken into sprints)
- Testing

Agile Software Development Process

Free Support

This is the support phase where we take care of the bugs that may be raised after the final release and reported by users. After completing the website, 45 days of free bug removal support (only on existing functionality) will be provided to you.

Incident Support

Incident support is priority-based support where as soon as a ticket is raised, a dedicated resource will work on it. The incident-based support is chargeable per hour.

Direct Support

Direct support means dedicated support, in this case, one dedicated resource is always there to resolve any issues or upgrade the application. This is charged monthly.

Thank you for considering us

We'll look forward to hearing back from you.

If there is anything that requires more clarification, just let us know. We will assist you accordingly.
